

Replication of ‘The Likelihood of Mixed Hitting Times’

Jaap H. Abbring*

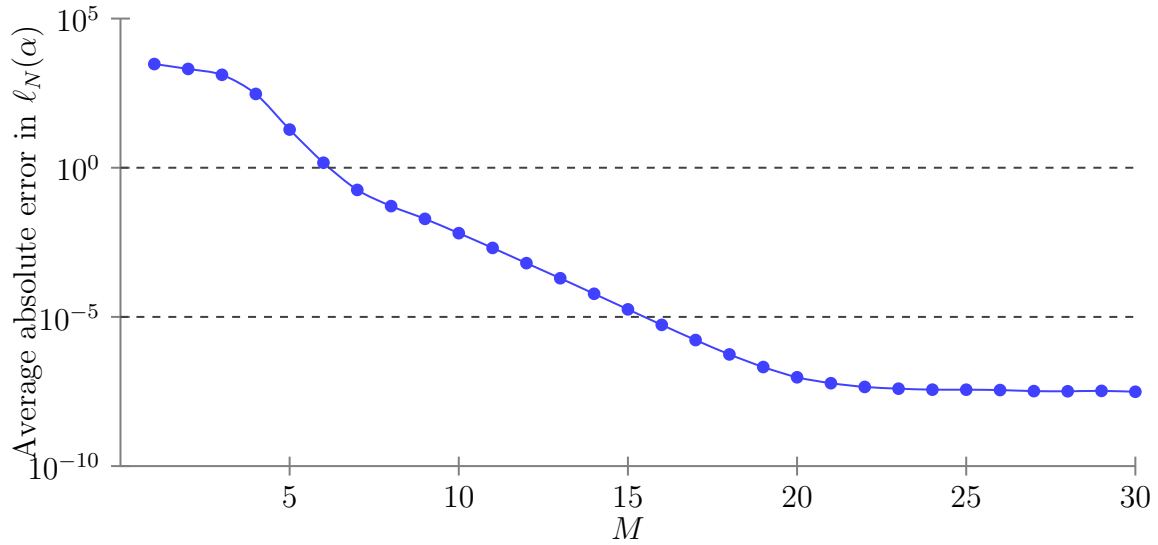

Tim Salimans†

December 2, 2020

This document reports on the replication of Abbring and Salimans (2021a). It was generated by running `make` in the replication package (Abbring and Salimans, 2021b).

1 Main Results

Figure 1: Approximation Error of the Log Likelihood for Various M

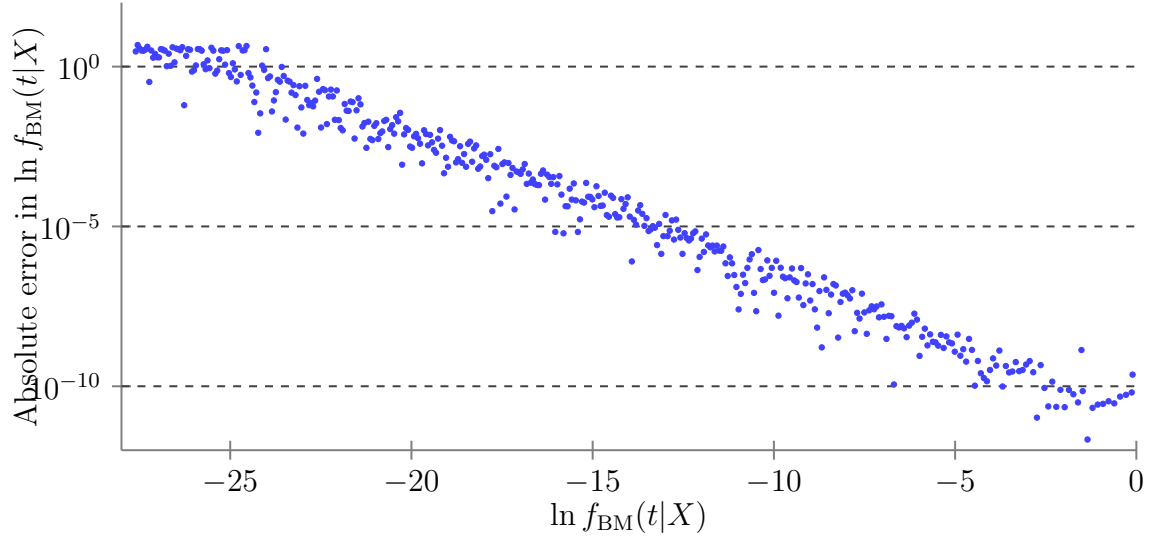

*CentER, Department of Econometrics & OR, Tilburg University, P.O. Box 90153, 5000 LE Tilburg, The Netherlands. E-mail: jaap@abbring.org. Web: jaap.abbring.org.

The research of Jaap Abbring is financially supported by the Netherlands Organisation for Scientific Research (NWO) through Vici grant 453-11-002.

Figure 2: Approximation Error of the Log Inverse Gaussian Density Function

Note: Mean calculation times are $6.14557e - 04$ seconds (analytical) and $6.38863e - 03$ seconds (numerical inversion), so that mean time numerical = $10.40 \times$ mean time analytical

Figure 3: Approximate Probability Density and Histogram of Simulated Values of $\ln T$ for a Specification With Shocks and Heterogeneity

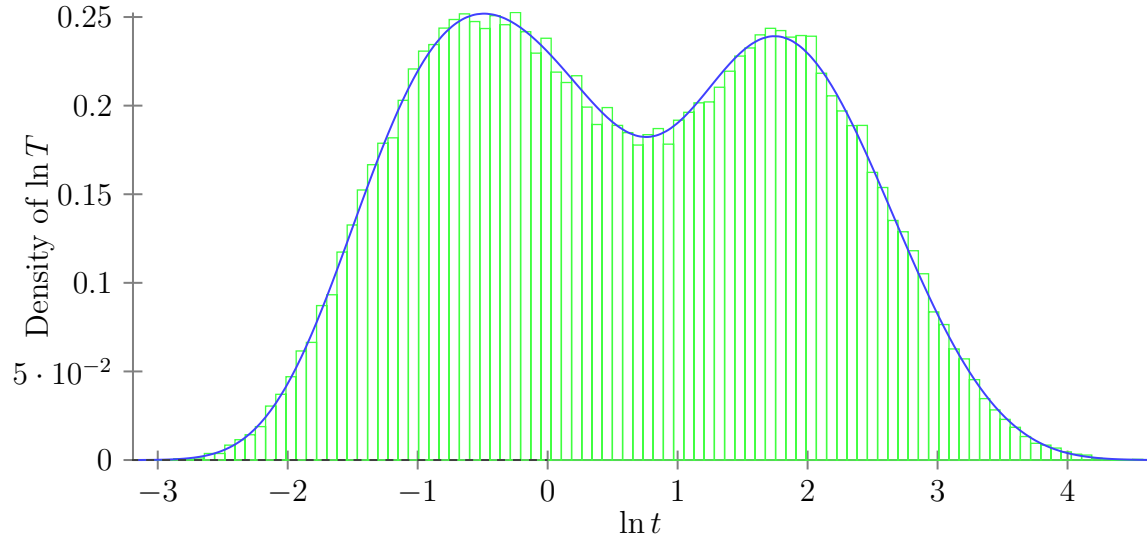

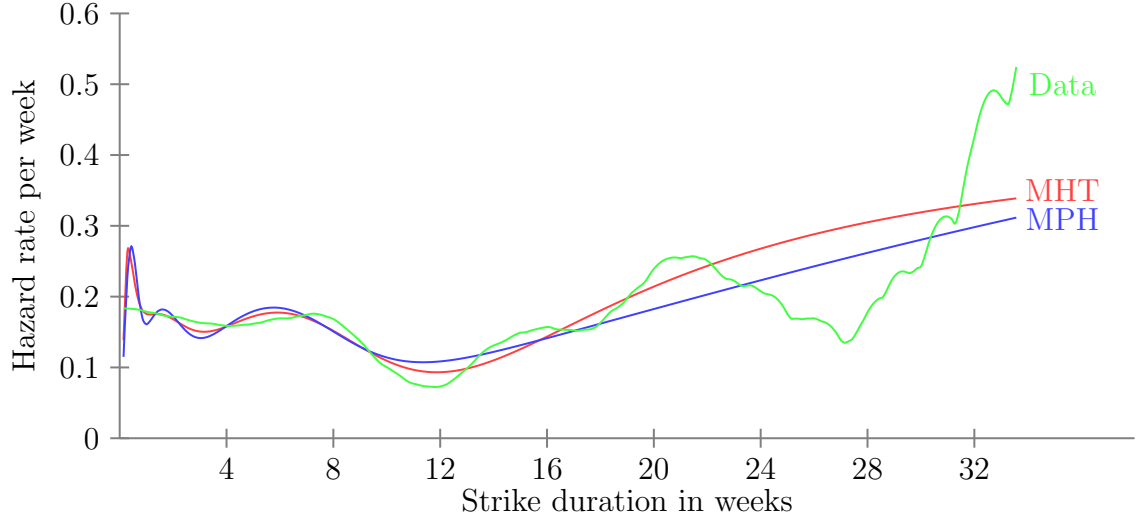

Table 1: Maximum Likelihood Estimates for Kennan's (1985) Strike Duration Data

	I	II	III	IV	V	VI
μ	1 (0)	1 (0)	1 (0)	1 (0)	1 (0)	1 (0)
σ^2	19.659 (3.951)	6.219 (0.888)	2.067 (0.376)	1.227 (0.387)	1.197 (0.479)	0.542 (0.165)
λ						0.019 (0.017)
ν						-5.132 (2.412)
β	-0.931 (0.828)	-1.772 (0.714)	-1.085 (0.696)	-0.867 (0.617)	-0.862 (0.979)	-0.579 (0.688)
v_1	6.260 (0.543)	2.543 (0.211)	1.537 (0.134)	1.105 (0.200)	1.031 (0.531)	0.755 (0.113)
v_2		8.751 (0.525)	5.888 (0.382)	3.209 (0.750)	1.756 (1.804)	2.083 (0.526)
v_3			18.161 (1.007)	7.165 (0.711)	3.518 (0.937)	4.138 (0.859)
v_4				18.557 (0.712)	7.303 (0.739)	7.412 (0.563)
v_5					18.575 (0.838)	17.004 (0.885)
π_1	1.000 (0.000)	0.399 (0.043)	0.353 (0.034)	0.252 (0.052)	0.199 (0.301)	0.198 (0.041)
π_2		0.601 (0.043)	0.492 (0.035)	0.283 (0.053)	0.098 (0.346)	0.201 (0.066)
π_3			0.154 (0.022)	0.315 (0.075)	0.256 (0.087)	0.223 (0.062)
π_4				0.151 (0.019)	0.297 (0.095)	0.238 (0.058)
π_5					0.150 (0.020)	0.140 (0.020)
ℓ_N	-1658.9	-1588.7	-1583.0	-1576.3	-1576.1	-1575.4

Note: The drift is normalized to 1 per week. All specifications include a single covariate, Kennan's (1985) deseasonalized and detrended log industrial production. Asymptotic standard errors are in parentheses.

Figure 4: Aggregate Strike End Hazard Rates

The numbers in Column IV imply that there are four unobserved types of labor conflict, on average commanding respectively 1.1, 3.2, 7.2, and 18.6 strike weeks.

	I	II	III	IV	V	VI
Computation times (in seconds):	1.4	1.6	3.6	5.0	13.9	26.4

Both the MHT and the MPH models fit the empirical hazard well, but the MPH model's log likelihood, at -1577.9 , is 1.6 points lower.

2 Other Checks
